

Stop fake signups and swiftly authenticate legitimate customers with Account Protect.

Account fraud is one of the **top three** most common fraud attacks

\$3.4B overall losses in the US (2018)

Verification friction results in **lost leads and revenue¹**

Add friction only when necessary

Small account changes like updating a password or an email address could be legitimate behavior. They could also be signs of fraud.

Vesta Account Protect knows the difference and can add friction when necessary to prevent an attack. Our advanced machine learning models know your customers' devices and behavior so we can readily flag suspicious activity before damage occurs.

Embeds on verified account-holder device to detect stolen information and monitor log-in activity

Seamless and configurable identity verification for different verticals

Verifies proof of identity without storing personal information

In-session monitoring detects suspicious behavior in real time

Keep legitimate customers happy

Say goodbye to false declines and cumbersome processes. The Vesta Account Protect Solution Suite provides fast, accurate, and frictionless verification for every industry without getting in your customers' way.

The secret is our two modules working together to continuously safeguard the account from signup to log out. You may purchase them separately or bundle with other Vesta solutions for superior fraud detection and prevention.

Account Protect

Account Verification

Ensures proof of identity at signup with real-time ID verification tools that flex with your security needs. This includes document verification, facial matching, and liveness testing.

We support multiple document types including utility bills, passports and driver's licenses, and compare the data against several sources to detect tampering and verify authenticity.

Account Monitoring

Detects and eliminates account takeovers by checking session behavior against known customer data in real time.

If risky behavior is detected during a session, we safely add friction and force authentication to prevent an attack.
